## AMENDMENTS TO THE CLAIMS

The following listing of claims will replace all prior versions, and listings, of claims in the application:

## **Listing of Claims:**

Claims 1-62 (cancelled)

Claim 63 (new) A data acquisition system for gathering geophysical data, said system comprising:

at least one data acquisition unit connectable to a plurality of sensors and being arranged, during use, to simultaneously gather geophysical data from the sensors, the at least one data acquisition unit comprising time referencing means arranged to generate time reference data usable to control the time at which samples of geophysical data are taken; and

means for calculating spatial derivatives between simultaneous samples associated with adjacent sensors connected, during use, to the at least one data acquisition unit.

Claim 64 (new) The data acquisition system as claimed in claim 63, wherein the time referencing means comprises a GPS receiver.

Claim 65 (new) The data acquisition system as claimed in claim 63, wherein the time referencing means comprises an accurate oscillator.

Claim 66 (new) The data acquisition system as claimed in claim 65, wherein the accurate oscillator comprises a precision oven controlled crystal oscillator, and the time referencing means further comprises a counter arranged to count signals generated by the crystal oscillator.

Claim 67 (new) The data acquisition system as claimed in claim 65, wherein the data acquisition unit is arranged to receive synchronisation signals useable to adjust a frequency of the oscillator and thereby adjust the times at which samples of geophysical data are taken so that the times at which samples of geophysical data are taken are synchronised with the times at which samples of geophysical data are taken in other data acquisition units.

Claim 68 (new) The data acquisition system as claimed in claim 63, wherein the data acquisition unit is arranged to receive and store programs for subsequent execution.

Claim 69 (new) The data acquisition system as claimed in claim 63, wherein the data acquisition unit is arranged to calculate an average sample value for a plurality of corresponding repeat sample values when a plurality of data gathering operations are carried out as part of a geophysical survey so as to reduce an effect of interference on the samples and reduce the quantity of data.

Claim 70 (new) The data acquisition system as claimed in claim 69, wherein the

data acquisition unit is arranged to compare repeat samples and to discard samples which differ by a predetermined amount from a majority of the repeat samples.

Claim 71 (new) The data acquisition system as claimed in claim 63, wherein the data acquisition unit is arranged to calculate an average sample value for a plurality of consecutive samples taken during a data gathering operation carried out as part of a geophysical survey so as to produce a representative sample for the consecutive samples.

Claim 72 (new) The data acquisition system as claimed in claim 63, wherein the data acquisition unit is arranged to estimate the amount of interference present at a survey site.

Claim 73 (new) The data acquisition system as claimed in claim 72, wherein the amount of interference present is estimated by carrying out a first data gathering operation with an incident magnetic field of a first polarity so as to produce a first response, carrying out a second data gathering operation with an incident magnetic field of a second polarity so as to produce a second response, and calculating a sum of the first and second responses so as to cause the first and second responses to cancel out.

Claim 74 (new) The data acquisition system as claimed in claim 63, wherein the data acquisition unit is arranged to filter gathered geophysical data so as to remove periodic interference.

Claim 75 (new) The data acquisition system as claimed in claim 63, wherein the data acquisition unit is arranged to convert gathered geophysical data into frequency domain using Fourier transform analysis.

Claim 76 (new) The data acquisition system as claimed in claim 63, wherein the data acquisition unit is arranged to generate at least one quality control indicator for use in assessing a quality of the gathered geophysical survey data.

Claim 77 (new) The data acquisition system as claimed in claim 76, wherein the data acquisition unit is arranged to calculate a standard deviation value for the gathered geophysical survey data.

Claim 78 (new) The data acquisition system as claimed in claim 63, wherein the data acquisition unit is arranged to adjust a level of gain applied to gathered geophysical survey data based on an assessment of a magnitude of the gathered geophysical survey data.

Claim 79 (new) The data acquisition system as claimed in claim 63, wherein the data acquisition unit is arranged to downward extrapolate gathered geophysical survey data so as to enhance detail of a target located below a surface of a survey area.

Claim 80 (new) The data acquisition system as claimed in claim 63, wherein the

data acquisition unit is connectable to an energy source, the data acquisition unit is arranged to gather energy source output data from the energy source, and the time referencing means is arranged so as to sample the gathered energy source output data.

Claim 81 (new) The data acquisition system as claimed in claim 80, wherein the system is arranged to correct for variations in magnitude of the energy source output during a geophysical survey.

Claim 82 (new) The data acquisition system as claimed in claim 76, wherein the system is arranged to correct for a variation in magnitude of the gathered geophysical data caused by a variation in power supplied to the energy source.

Claim 83 (new) The data acquisition system as claimed in claim 63, further comprising at least one interface arranged to facilitate transfer of geophysical data and/or programs to or from the data acquisition unit.

Claim 84 (new) The data acquisition system as claimed in claim 83, wherein the data acquisition unit comprises a multi-tasking operating system.

Claim 85 (new) The data acquisition system as claimed in claim 84, wherein the data acquisition unit is arranged to facilitate transfer of geophysical data from the data acquisition unit during a geophysical survey.

Claim 86 (new) The data acquisition system as claimed in claim 83, wherein the interface comprises at least one of an infra red interface, a serial interface, and a network interface.

Claim 87 (new) The data acquisition system as claimed in claim 63, wherein the data acquisition unit is arranged to store a correction coefficient for each sensor connected during use to the data acquisition unit, each correction coefficient being used to correct for variations in sensor sensitivity.

Claim 88 (new) The data acquisition system as claimed in claim 63, further comprising display means arranged to provide information indicative of operation of the data acquisition unit to an operator.

Claim 89 (new) The data acquisition system as claimed in claim 63, wherein the data acquisition unit includes the means for calculating spatial derivatives.

Claim 90 (new) The data acquisition system as claimed in claim 63, wherein the means for calculating spatial derivatives is separate from the data acquisition unit.

Claim 91 (new) The data acquisition system as claimed in claim 90, further including a portable computing device, the portable computing device including the means for calculating spatial derivatives.

Claim 92 (new) The data acquisition system as claimed in claim 63, comprising

National Stage of PCT Application No.: PCT/AU2003/000770 Amendment Dated: December 16, 2004

a plurality of data acquisition units.

Claim 93 (new) The data acquisition system as claimed in claim 63, further comprising:

at least one reference data acquisition unit, each reference data acquisition unit being connectable to at least one reference sensor and being arranged, during use, to gather geophysical data from the at least one reference sensor, and to take samples of the geophysical data gathered from the at least one reference sensor;

wherein the means for calculating spatial derivatives between samples associated with adjacent sensors is arranged to calculate first spatial derivatives between at least some of the sensors and the at least one reference sensor connected to the reference data acquisition unit during a first data gathering operation when the sensors are disposed in a first location, to calculate second spatial derivatives between at least some of the sensors and the at least one reference sensor connected to the reference data acquisition unit during a second data gathering operation when the sensors are disposed in a second location, and to calculate a difference spatial derivative between the first and second spatial derivatives, each said difference spatial derivative being indicative of a spatial derivative between a sensor disposed in a first location and a sensor disposed in a second location.

Claim 94 (new) The data acquisition system as claimed in claim 93, further comprising means for calculating an integral of the spatial derivatives.

Claim 95 (new) The data acquisition system as claimed in claim 93, further comprising an energy source arranged to generate and direct energy towards a subsurface volume so as to cause a geophysical response and thereby cause generation of the geophysical signals.

Claim 96 (new) The data acquisition system as claimed in claim 95, wherein the energy source includes a transmitter and a transmitter loop.

Claim 97 (new) The data acquisition system as claimed in claim 93, further comprising an energy source control unit connectable to the energy source and arranged to gather output data from the energy source, the energy source control unit comprising time referencing means arranged to generate time reference data usable to control the time at which samples of the energy source output data are taken and to associate the energy source output data with the time reference data.

Claim 98 (new) The data acquisition system as claimed in claim 97, wherein the energy source control unit is a transmitter control unit arranged to control a transmitter so as to energise a transmitter loop in accordance with a predetermined frequency.

Claim 99 (new) The data acquisition system as claimed in claim 97, wherein the energy source control unit includes the same components as the data acquisition unit so that the transmitter control unit is capable of carrying out the functions of the data acquisition unit and vice versa.

Claim 100 (new) A method of acquiring geophysical data, said method including the steps of:

providing at least one data acquisition unit arranged to simultaneously gather geophysical data from a plurality of sensors connected in use to the at least one data acquisition unit;

connecting a plurality of sensors to the at least one data acquisition unit;

generating at the data acquisition unit time reference data usable to control

the time at which gathering of samples of geophysical data are taken; and

calculating spatial derivatives between simultaneous samples associated with

adjacent sensors connected during use to the at least one data acquisition unit.

Claim 101 (new) The method of acquiring geophysical data as claimed in claim 100, further comprising the steps of:

providing at least one reference data acquisition unit arranged, during use, to gather geophysical data from at least one reference sensor;

connecting each of the at least one reference data acquisition unit to at least one of the at least one reference sensors;

calculating first spatial derivatives between at least some of the sensors connected to the data acquisition units and the at least one reference sensor connected to the at least one reference data acquisition unit during a first data gathering operation when the sensors are disposed in a first location;

calculating second spatial derivatives between at least some of the sensors connected to the data acquisition units and the at least one reference sensor

connected to the at least one reference data acquisition unit during a second data gathering operation when the sensors are disposed in a second location; and

calculating a difference spatial derivative between the first and second spatial derivatives, each said difference spatial derivative being indicative of a spatial derivative between the first location and a sensor the second location.

Claim 102 (new) The method as claimed in claim 100, further comprising means for calculating an integral of the spatial derivatives.

Claim 103 (new) The method as claimed in claim 100, wherein the step of generating time reference data comprises the step of providing a GPS receiver.

Claim 104 (new) The method as claimed in claim 100, wherein the step of generating time reference data comprises the step of providing an oscillator.

Claim 105 (new) The method as claimed in claim 104, wherein the oscillator comprises a precision oven controlled crystal oscillator, and the step of generating time reference data further comprises the step of providing a counter arranged to count signals generated by the crystal oscillator.

Claim 106 (new) The method as claimed in claim 104, further comprising the step of facilitating reception at the data acquisition unit of synchronisation signals useable by the processing means to adjust a frequency of the oscillator and thereby adjust the time at which samples of geophysical data are taken so as to synchronise the

time at which samples of geophysical data are taken with the time at which samples of geophysical data are taken in other data acquisition units.

Claim 107 (new) The method as claimed in claim 100, further comprising the steps of receiving and storing programs at the data acquisition unit for subsequent execution by the processing means.

Claim 108 (new) The method as claimed in claim 100, further comprising the step of calculating an average sample value for a plurality of corresponding repeat sample values when a plurality of data gathering operations are carried out as part of a geophysical survey so as to reduce an effect of interference on the samples and reduce the quantity of data.

Claim 109 (new) The method as claimed in claim 100, further comprising the step of comparing repeat sample values and discarding samples which differ by a predetermined amount from a majority of the repeat sample values.

Claim 110 (new) The method as claimed in claim 100, further comprising the step of calculating an average sample value for a plurality of consecutive samples taken during a data gathering operation carried out as part of a geophysical survey so as to produce a representative sample for the consecutive samples.

Claim 111 (new) The method as claimed in claim 100, further comprising the step of estimating the amount of interference present at a survey site.

Claim 112 (new) The method as claimed in claim 111, wherein the amount of interference present is estimated by carrying out a first data gathering operation with an incident magnetic field of a first polarity so as to produce a first response, carrying out a second data gathering operation with an incident magnetic field of a second polarity so as to produce a second response, and calculating the sum of the first and second responses so as to cause the first and second responses to cancel out.

Claim 113 (new) The method as claimed in claim 100, further comprising the step of filtering gathered geophysical data so as to remove periodic interference.

Claim 114 (new) The method as claimed in claim 100, further comprising the step of converting gathered geophysical data into frequency domain using Fourier transform analysis.

Claim 115 (new) The method as claimed in claim 100, further comprising the step of correcting for variations in magnitude of an energy source during a geophysical survey.

Claim 116 (new) The method as claimed in claim 115, wherein the step of correcting for variations in magnitude includes the step of correcting for a variation in magnitude of the energy source caused by a variation in power supplied to the energy source.

Claim 117 (new) The method as claimed in claim 100, further comprising the step of generating at least one quality control indicator for use in assessing the quality of the gathered geophysical survey data.

Claim 118 (new) The method as claimed in claim 117, further comprising the step of calculating a standard deviation value for the gathered geophysical survey data.

Claim 119 (new) The method as claimed in claim 100, further comprising the step of adjusting a level of gain applied to gathered geophysical survey data based on an assessment of the magnitude of the gathered geophysical survey data.

Claim 120 (new) The method as claimed in claim 100, further comprising the step of downward extrapolating gathered geophysical survey data so as to enhance detail of a target located below a surface of a survey area.

Claim 121 (new) The method as claimed in claim 100, wherein the method further comprises the step of facilitating transfer of processed geophysical data and/or programs to or from the data acquisition unit.

Claim 122 (new) The method as claimed in claim 100, further comprising the step of providing each data acquisition unit with display means for providing information indicative of operation of the data acquisition unit to an operator.

Claim 123 (new) The system as claimed in claim 95, wherein the system is arranged to correct variations in the energy source using the reference data acquisition unit and associated reference sensor.

Claim 124 (new) The method as claimed in claim 115, further comprising the step of correcting variations in the energy source using the reference data acquisition unit and associated reference sensor.

Claim 125 (new) A data acquisition system for gathering geophysical data, said system comprising:

at least one data acquisition unit connectable to a plurality of sensors and being arranged, during use, to simultaneously gather geophysical data from the sensors, the at least one data acquisition unit comprising time referencing means arranged to generate time reference data usable to control a time at which samples of geophysical data are taken; and

a processor arranged to calculate spatial derivatives between simultaneous samples associated with adjacent sensors connected during use to the at least one data acquisition unit.
